Webinar Series

18 Nov 2020: 07:00AM UTC

Defending assessment against e-Cheating: design and standards

Associate Professor Phillip (Phill) Dawson
Deakin University, Australia

Webinar Hosts

Professor Geoff Crisp,
Deputy Vice-Chancellor & Vice-President Academic
University of Canberra
g.crisp[at]canberra.edu.au

Dr Mathew Hillier,
Macquarie University
mathew.hillier[at]gmail.com

Just to let you know:

By participating in the webinar you acknowledge and agree that:
The session may be recorded, including voice and text chat communications (a recording indicator is shown inside the webinar room when this is the case).

We may release recordings freely to the public which become part of the public record.

We may use session recordings for quality improvement, or as part of further research and publications.

Digital Learning (CRADLE)

Deakin University, Melbourne, Australia

PHILLIP DAWSON

DEFENDING ASSESSMENT SECURITY IN A DIGITAL WORLD

Preventing E-Cheating and
Supporting Academic Integrity
in Higher Education

Win a free copy of the ebook!

- Routledge has provided one ebook copy to be given away at this launch
- The copy will go to whoever is the first to post a specific link that I request while a slide with the title “Time to give out a free book” is being presented
- Whoever wins will need to send me a private message via this system before the end of the session
- My decision about who was first to post the link is final

Three things to take from this presentation

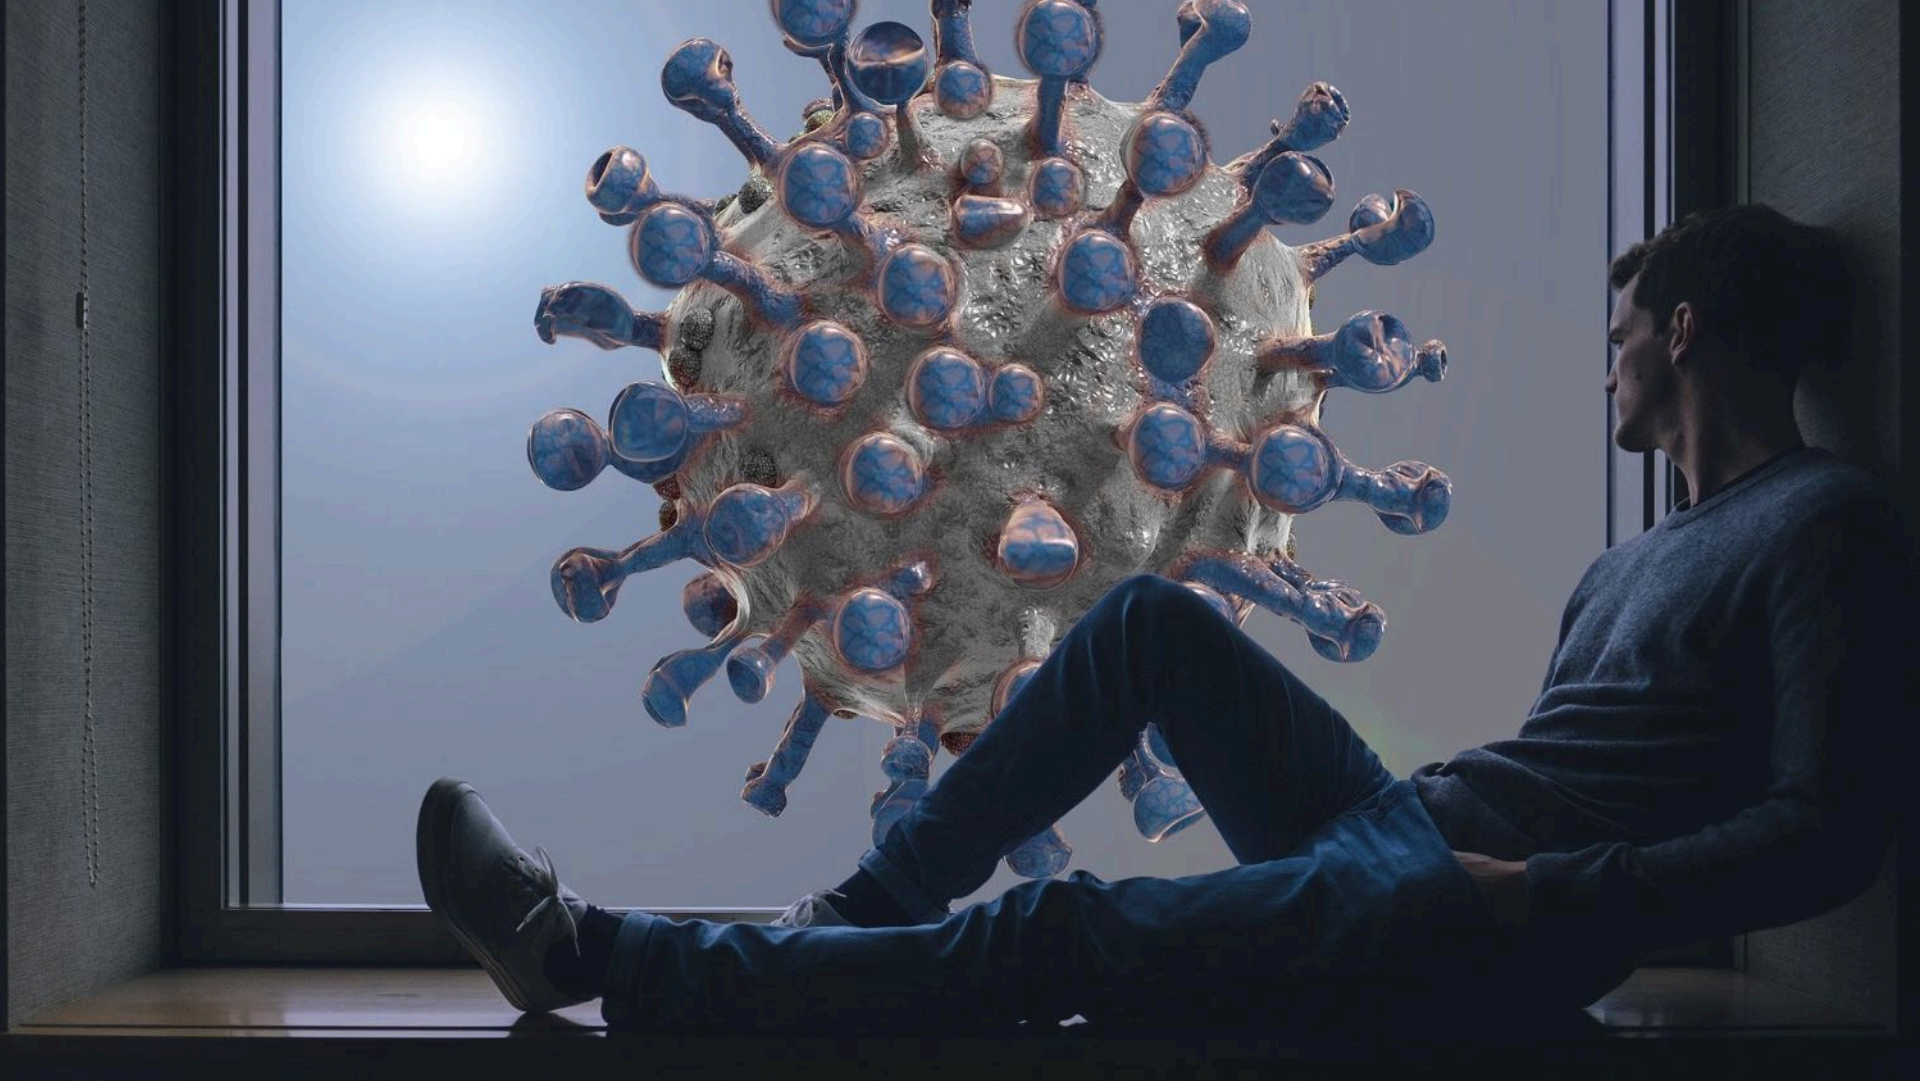

Balance academic integrity
and assessment security

Assessment design helps
but it's not enough

Set standards for
assessment security

Disclaimer

- I support AfL & AI
- I think cheating is a symptom of broader problems
- I think universities have a responsibility to try to prevent and detect cheating
- I receive research funding from ed tech companies
- My mum helped me contract cheat in year four

e-cheating:

**“cheating that uses or
is enabled by digital
technology”**

Buy Essay Online - We Write The Best Essays in Australia

Our writing service is the best website to **buy** an **essay** from. We guarantee high quality standards, offering discounts and 24/7 online support for every student.

★★★★★ Rating: 4.9 - 49 reviews

au.edubirdie.com › buy-essays-online ▼

Buy Essay at Australian Writing Service - Au.EduBirdie.com

BUY AN ESSAY FROM AUSTRALIAN WRITERS. If you are a busy student loaded with college papers - there is no other chance to get your paper done ...

Can I buy an essay online?

Can I communicate with my writer during the process?

Is buying an essay safe?

It is absolutely safe as you pay only when you receive the paper and feel content with what you get. All the payments are fully refundable and there are no extra charges. Your money is always kept safe in your personal system's balance as you wait.

Is using Chegg Cheating? How to not get Caught Cheating 2020

Published by  Alicia Smart at  June 28, 2020

Some uses of study sites

E-cheating is different because it...

- does not require any cleverness or hard work on the part of students.
- can be packaged up and shared freely.
- can be bought with a credit card.
- can be anonymous.
- is pushed to students by social media and online advertisements.
- usually rates higher on web searches than legitimate help.
- evolves at the pace of technology.
- is never more than a web search away.

Defending Assessment Security in a Digital World

Preventing E-Cheating and Supporting Academic Integrity in Higher Education

Three things to take from this presentation

Balance academic integrity
and assessment security

Assessment design helps
but it's not enough

Set standards for
assessment security

Balance academic integrity and assessment security

- Academic integrity is positive, educative and values-based
- Assessment security is adversarial, punitive and evidence-based
- In tension, but not a dichotomy

Fundamental values of academic integrity

- Honesty
- Trust
- Fairness
- Respect
- Responsibility
- Courage

Assessment security:

“measures taken to harden assessment against attempts to cheat. This includes approaches to detect and evidence attempts to cheat, as well as measures to make cheating more difficult.”

(Dawson, 2021)

Addressing cheating requires...

Academic Integrity

- Trusting
- Educative
- Proactive

Think 'crime prevention'

Assessment security

- Detecting
- Punitive
- Proactive or reactive

'policing' or 'surveillance'

It's a balance, not a dichotomy

Three things to take from this presentation

Balance academic integrity
and assessment security

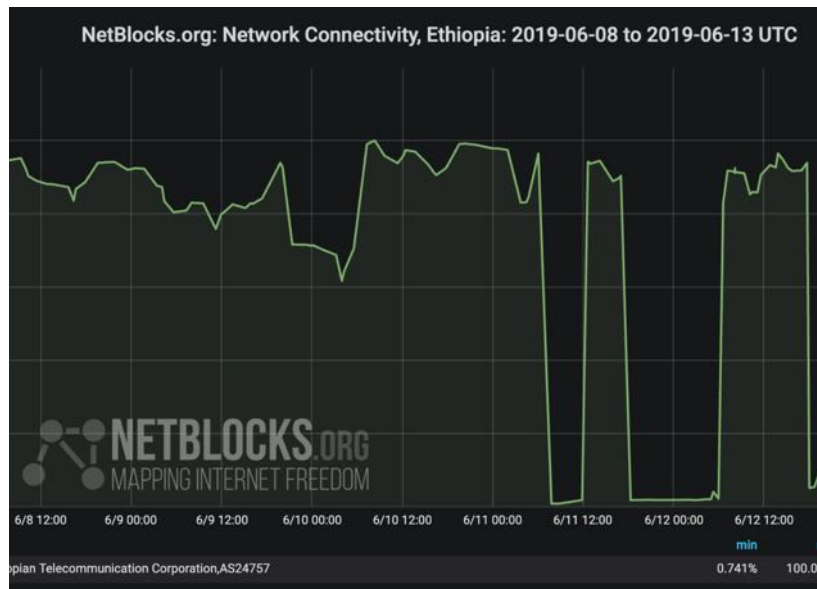

Assessment design helps
but it's not enough

Set standards for
assessment security

Assessment design helps but it's not enough (but neither is any other one thing)

- Harsh restrictions won't stop cheating
- Technology won't stop cheating
- Blind faith won't stop cheating
- Cheating can occur in any task type
- No single solution

Banning essays won't save us.
Authentic assessment won't save us.
Contract cheating can occur with any task type.

(Ellis et al, 2019)

Exams won't save us.

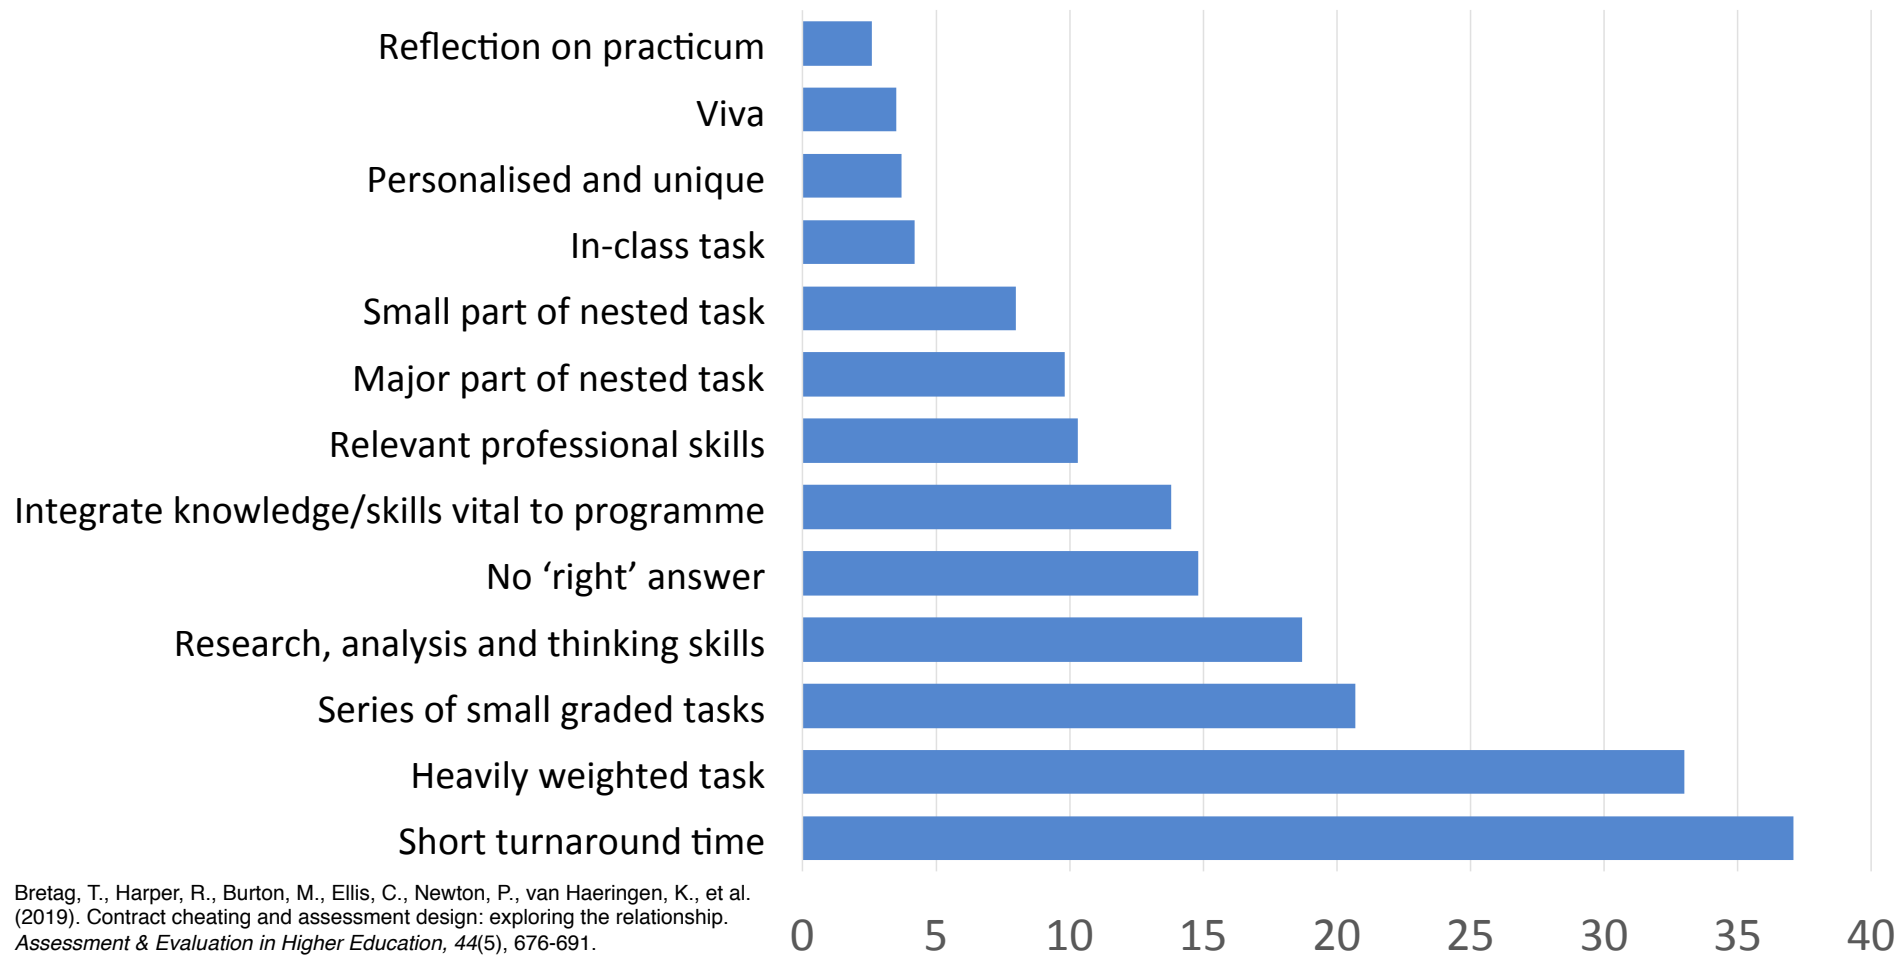

'Third party cheating' is likely more common in exams than assignments.

'Third party cheating' is likely detected less often in exams than assignments.

(Harper et al, 2020)

(Based on comparisons of self-reported student cheating and educator detection rates – so take with caution)

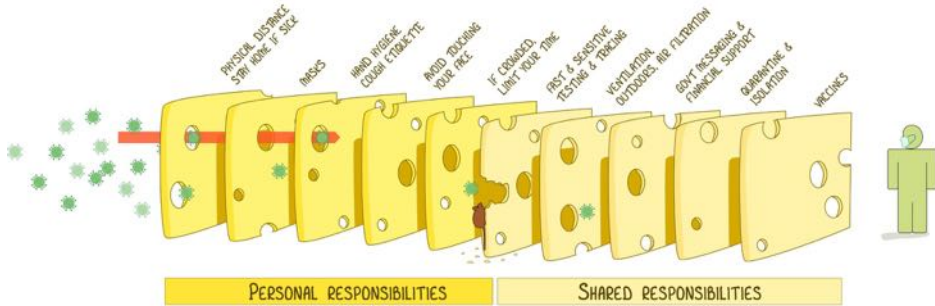

Students' perceptions of the likelihood of contract cheating (%)

Bretag, T., Harper, R., Burton, M., Ellis, C., Newton, P., van Haeringen, K., et al. (2019). Contract cheating and assessment design: exploring the relationship. *Assessment & Evaluation in Higher Education*, 44(5), 676-691.

UPDATE: 24OCT2020

Rundle, K., Curtis, G., & Clare, J. (2020). Why students choose not to cheat. In T. Bretag (Ed.), *A Research Agenda for Academic Integrity*. Edward Elgar Publishing.

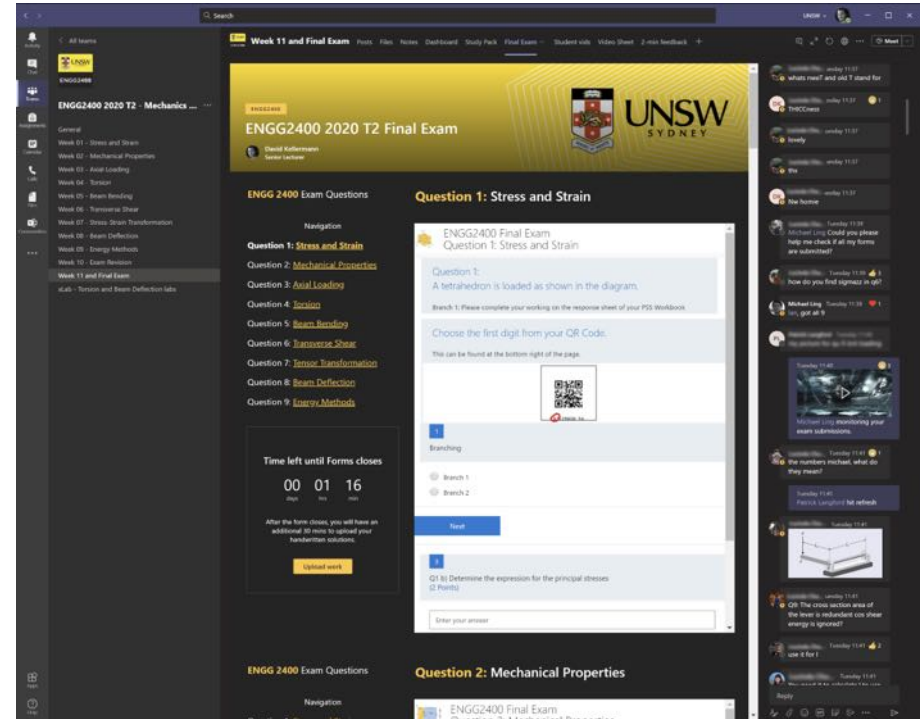

Authentic restrictions:

Authentic *assessment* is great but it doesn't stop cheating. Authentic *restrictions* might.

Restrictions need to be enforced, and therefore make assessment harder to secure.

Authentic restrictions reduce the 'attack surface'.

Allowing students tools, collaboration and/or information reduces the options for cheating.

<https://teaching.unsw.edu.au/academic-integrity/case-studies>

David Kellermann UNSW @DrKellermann

Programmatic assessment security:

‘Cheat-proofing’ every act of assessment is probably impossible and definitely a bad idea.

Focus on securing those acts of assessment that matter to the degree program outcomes.

Focus on developing academic integrity in the others.

“If we trust students not to cheat then cheating rates will go down” sounds good but evidence is thin.

(e.g. honor codes help, but only explain a small amount of the variance in cheating rates)

(McCabe et al 2002)

Consider the pros and cons of remote proctoring – and **demand evidence**

Do students *really* hate proctoring so much?

Is proctoring *actually* an effective anti-cheating measure?

For more on remote
proctoring see this guide on

Time to give out a free book!

Free e-copy will go to the first person to post a link in the chat to the gofundme for a Canadian learning technologist who is being sued by a remote proctoring company.

Random audit:

‘Cheat-proofing’ every act of assessment is probably impossible and definitely a bad idea.

Consider random audit of individual students’ work.

The possibility of an audit is associated with more honest behavior in other contexts (e.g. tax)

Unreliable & invalid

Reliable but invalid

B

Unreliable but v

D

If it's not valid & reliable assessment of learning, it's not worth securing.

Three things to take from this presentation

Balance academic integrity
and assessment security

Assessment design helps
but it's not enough

Set standards for
assessment security

Seven proposed standards for assessment security

Coverage across a programme

How much of a degree should be secured?

Securing everything, nothing, or in a haphazard way is unacceptable

Securing the major task in each unit/module is commonplace but we can do better

Best practice is programmatic

Authentication

How do we ensure the student is who they say they are?

Unacceptable to not attempt this (**for the tasks we are securing**)

Minimum is to use photo ID or something else like stylometrics or biometrics – but this just establishes who they are right now

Aspirational is to dialogue with students about the work

Control of circumstances

How can we be sure the task was done in the circumstances we designed for?

Unacceptable to not attempt to control (for the tasks we are securing)

Some tasks require a combination of proctoring, lockdown or text matching to be secure

At an aspirational level we should try non-text and/or semantic matching

Difficulty to cheat metrics

We need to know how hard tasks are to cheat in

Unacceptable to just assume tasks are hard to
cheat in without any evidence
(for the tasks we are securing)

At a minimum, educators should complete tasks
themselves and consider how to cheat

As an aspiration we should get specialists to audit
tasks for how difficult they are to cheat

Detection accuracy metrics

We need to know if our detection approaches work

Unacceptable to just assume we are detecting all cases

At a minimum, approaches should be based on research into detection

As an aspiration we should validate that detection approaches actually work

Proof metrics

We need to be able to prove cases of cheating

Unacceptable to not keep records about proof rates, or to only rarely prove cases

As a minimum, records need to be kept about proof rates, and proven cases should be relatively common

As an aspiration, proof rates should be externally audited and benchmarked

Prevalence metrics

We need to know approximate rates of undetected, detected and proven cheating in a cohort

Unacceptable to not attempt to compare rates of proven cases with expected rates

At a minimum, rates of proven cases should be benchmarked against prevalence data from similar programmes

As an aspiration, existing research is used to calculate prevalence of unproven cheating

Table 8.5 Hypothetical standards for assessment security.

	<i>Unacceptable: any of the following</i>	<i>Minimum: all of the following, as appropriate, and no unacceptable</i>	<i>Aspirational: minimum, plus</i>	<i>Excessive/overkill: aspirational, plus</i>
<i>Coverage across a programme</i>	No rationale for which tasks are secure	The major task in every unit/course is secure as below	At a degree level, all major outcomes have been assessed in a secure manner as below	All tasks are secure as below
<i>Authentication</i>	No attempt to verify identity	Photo ID; stylometrics; biometrics	Dialogue with students on completion of tasks	DNA tests
<i>Control of circumstances</i>	No attempt to control circumstances	Proctoring (remote or in person); lockdown; text matching	Content matching	Constant surveillance
<i>Difficulty to cheat metrics</i>	No attempt to verify difficulty to cheat	Educators attempt to cheat to test difficulty	Audit by specialists shows high difficulty	Audit by specialists shows impossible to cheat
<i>Detection accuracy metrics</i>	No attempt to verify detection accuracy	Detection methods based on research	Local detection methods verified by research	Perfect detection accuracy
<i>Proof metrics</i>	No attempt to verify proof rates; proven cases of cheating are rare	Record keeping of proof rates; proven cases of cheating are common	External audit of proof rates; benchmarking with other similar programmes	Experimental studies conducted to validate proof rates
<i>Prevalence metrics</i>	No attempt to compare rates of proven cases with expected rates	Rates of proven cases benchmarked against prevalence data and similar programmes	Existing research used to calculate prevalence of unproven cheating, which is less than 1% of student body	Local prevalence data is used to calculate prevalence of unproven cheating
